VS Code - getting your python running

Lau Møller Andersen

2026-10-22

IDE (Integrated Development Editor) options for running Python

- VSCode - the obvious choice, many of you are running it already
  - can convert notebooks, *.ipynb*, to pdf's, similar to knitting

Prerequisites: Having installed the *methods3_2026* environment (see Preamble)

How to check: from a terminal (Linux/Mac) or Anaconda Powershell Prompt (Windows) run `conda activate methods3_2026`

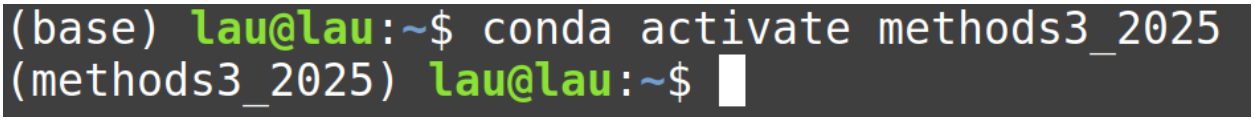

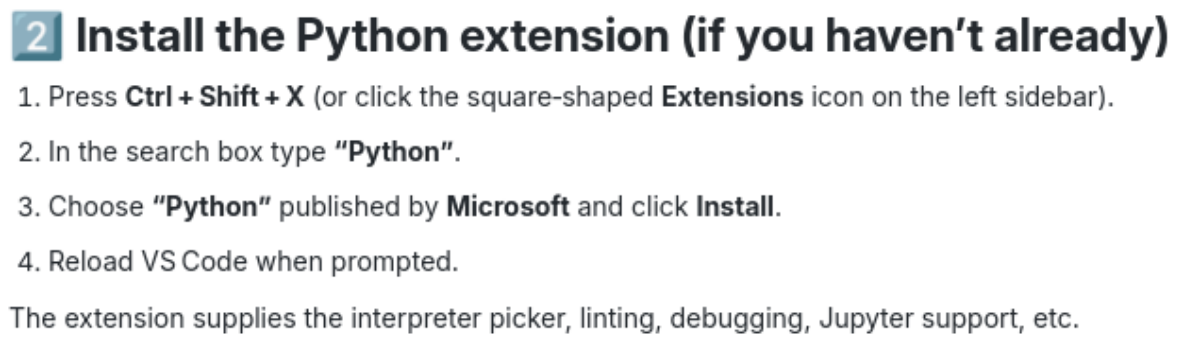

Figure 1: Activate conda env, (here shown with 2025)

VSCode

Here are some tested suggestions from Lumo (a GAI):

Also install the Jupyter extension

(An error that many had was that VS Code requested the package *ipykernel*, but couldn't install it even when clicking install. If so, open a terminal or anaconda prompt and write:)

```
conda activate methods3_2026
conda install ipykernel
```

4️⃣ Tell VS Code which Conda interpreter to use

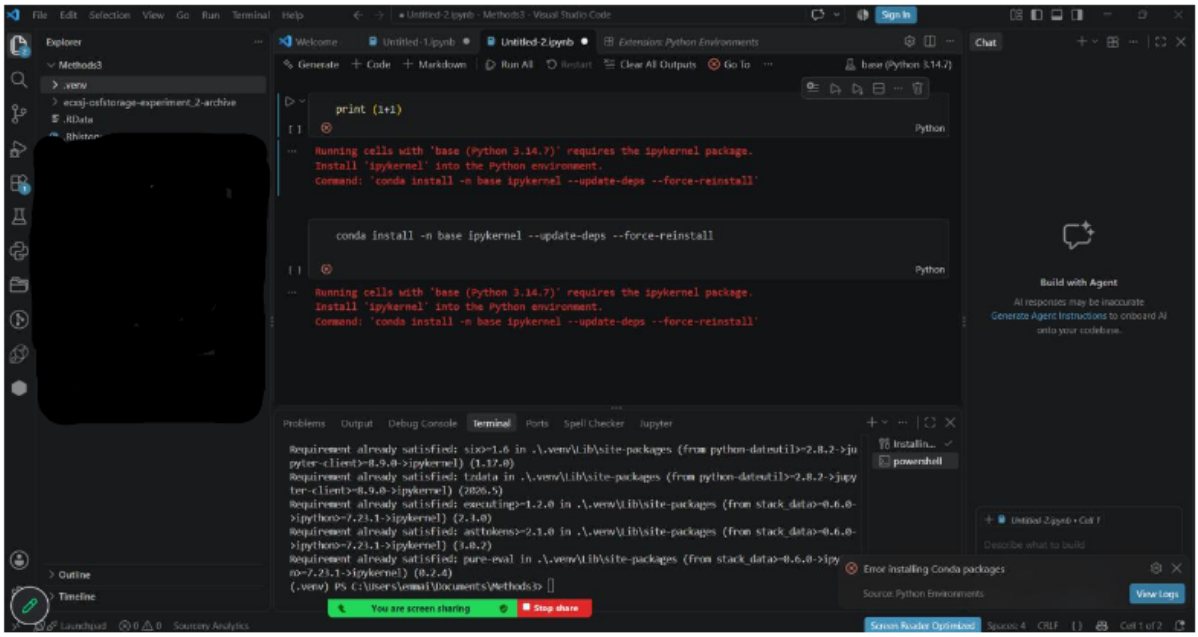

1. **Open a folder or workspace** in VS Code (`File → Open Folder…`).
2. Press **Ctrl + Shift + P** (or ⇧⌘P) to open the **Command Palette**.
3. Type **"Python: Select Interpreter"** and hit **Enter**.
4. You'll see a list that includes entries like:

```
Conda (myenv) • C:\Users\<you>\miniconda3\envs\myenv\python.exe
```

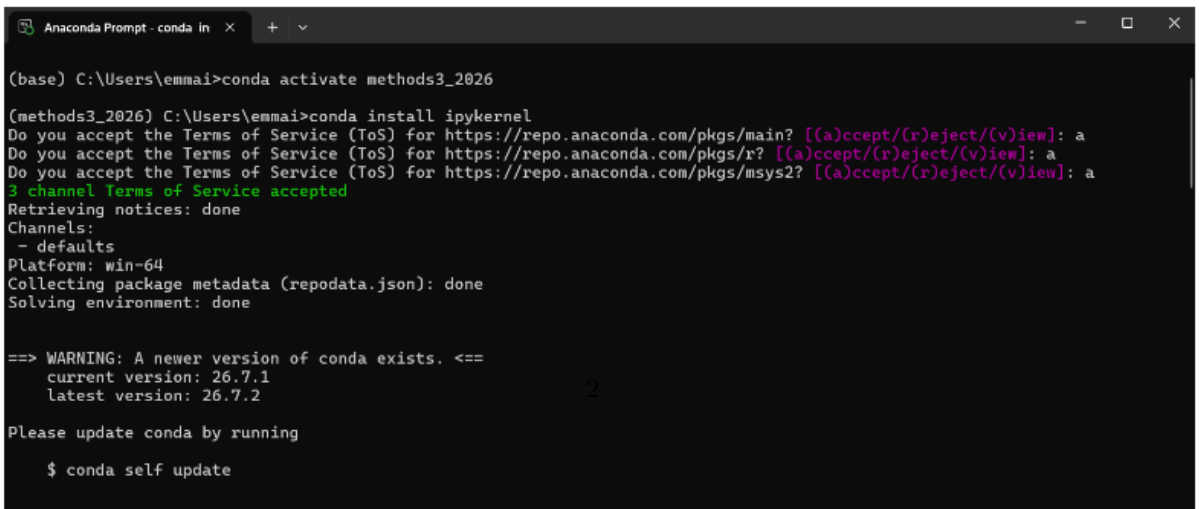

5. Click the entry that corresponds to the environment you want.

VS Code writes the selection to a hidden settings file inside the workspace:

Figure 2: Find conda env

Error installing so we download it manually in anaconda

Here with a screenshot from Emma's computer

Exporting to html

Please check these different methods link for creating html that you can then convert to pdf's from, e.g., a browser. **Remember pdf's are a requirement for assignments and exams**
